## FUNCTIONS

For all the functions the LEDs MIN and MAX are flashing alternating, when the minimum value for the measured voltage was chosen to be greater than the maximum value. If a failure already exists when the device is activated, the output relay R remains in off-position and the LED for the corresponding threshold is illuminated.

### Undervoltage monitoring (U)

When the measured voltage falls below the adjusted threshold  $U_{Min}$ , the set interval of the tripping delay (DELAY) begins. After the interval has expired, the output relay R switches into off-position. The output relay R switches into on-position again after the measured voltage exceeds the adjusted threshold  $U_{Max}$ .

### Window function (W)

When the measured voltage falls below the adjusted threshold  $U_{Min}$ , the set interval of the tripping delay (DELAY) begins. After the interval has expired, the output relay R switches into off-position. The output relay R switches into on-position again after the measured voltage exceeds the adjusted threshold  $U_{Min}$ . When the measured voltage exceeds the adjusted threshold  $U_{Max}$ , the set interval of the tripping delay (DELAY) begins. After the interval has expired, the output relay R switches into off-position. The output relay R switches into on-position again after the measured voltage falls below the adjusted threshold  $U_{Max}$ .
